GOAL

How to change the system account password in WebLogic 9.2 or WebLogic 10.3?

SOLUTION

1. Log on to the WebLogic Console as the system account: `https://<hostname>:<admin_port>/console`
2. Click on Security Realms under the Domain Structure on the left hand side of the Console.
3. On the right side click on myrealm and then choose the Users and Groups tab.
4. Click on system user.
5. Click on Passwords Tab.
6. Enter a new password in the New Password attribute.
7. Enter the new password again in the Confirm the Password attribute.
8. Click on the "Save" link in the Admin Console to save the new password.

If the password is in your `setEnv.sh/cmd` file you need to change it there as well. Follow these steps for the Admin and Managed servers.

1. Edit the file <PS_HOME>/webserve/<Domain>/bin/setEnv.sh or setEnv.cmd. Search for the line containing WLS_USER, if it defaults to system then change the password in WLS_PW=password.
2. Shut down and then restart the WebLogic server. If you are running a multi-server domain make sure you fully boot the Admin server before any Managed servers to avoid issues.
3. When restarting the Admin or the Managed server, if a boot.identity error is displayed, please refer to the following knowledge document [Note 624439.1](#)

**** Note **** If you are using a load balancer for the WebLogic Admin Console you must use the individual web server URL to change passwords in the console.
